Bulk customer messaging

Useful for sending bulk messages or notifications directly to customers through Amazon Seller Central.
This process takes an **inputs.txt** file containing a link to a text file, such as the provided bulk message URL. The system reads the data from the given link and prepares it for further processing. It is designed to support sending bulk messages or notifications efficiently. The extracted information can be used directly within **Amazon Seller Central** workflows. This helps sellers communicate important updates to multiple customers at once. It reduces manual effort involved in individual messaging. The process ensures consistency in the content sent to customers. It is especially useful for order updates, promotions, or important alerts. By automating bulk communication, sellers can save time and improve response efficiency. Overall, it streamlines customer engagement through Seller Central.

1 . Input

The tool requires an input file (such as `inputs.txt`) that contains a list of Order IDs. Instead of providing complete message content or bulk message links, the user only needs to include Order IDs in the file. Each Order ID represents a specific customer order for which a notification or message needs to be sent. This simplifies the input process and reduces manual work.

2 . How the Tool Works

This tool works in a simple automated way to send bulk messages through Amazon Seller Central. The user uploads a text file (like `inputs.txt`) containing Order IDs, and the tool processes it to generate a unique link with message data. This link is then placed in a bulk customer messaging application. When opened, it redirects to Amazon Seller Central, asks for login if required, and navigates to the messaging section. The system then fetches order details such as Product Name, Tracking ID, and Carrier for each Order ID and sends messages one by one automatically. This reduces manual work and makes bulk communication fast and efficient.

3 . Output File

After processing the input, the tool generates an output file containing the prepared messages for all the given Order IDs. This output file is structured in a way that it can be directly used within Amazon Seller Central for sending bulk messages. In output it show order id and success or fail.

4 . Output Details

Each record in the output file contains clearly formatted order information, such as:

- Order ID: ORDER
- Product Name: PRODUCT
- Tracking ID: TRACKING
- Carrier: COURIER
