Product_Images_v4

Product Image Metadata Fetcher – Usage Guide

This tool is designed to retrieve product image URLs and image details for a list of ASINs from Amazon listings. It automates the process of collecting product image data and generates a structured output file for easy analysis and documentation.

1. Input Instructions

- Create an input file named inputs.txt.
- Enter one ASIN per line.
- Ensure there are no extra spaces or additional characters.

Example input:

B09TRFK7D2
B08VWRW7X7
B0CP9YBWMG

2 . How the Tool Works

1. The system reads all ASINs from the inputs.txt file.
2. It processes each ASIN and retrieves product image information from the Amazon listing.
3. The tool collects multiple image details including:
    - Main product image URL
    - Thumbnail (left-side gallery) image URLs
    - Image dimensions
    - Variant information

4. All collected data is compiled into a structured output file.

3. Output File

After processing, the tool generates a CSV file named: PIM_output.csv.
This file contains all image-related data for each ASIN.

4. Output Details

The output file includes the following information:

- ASIN – Product identifier
- Main Image URL – Direct link to the primary product image
- Thumbnail Image URLs – Links to the small images displayed on the left side of the product page
- Image Height – Height of the image in pixels
- Image Width – Width of the image in pixels
- Image Pixels – Resolution information
- Variant – Image variant details (if applicable).

5. Purpose and Benefits

- Collect product images automatically without manual searching.
- Useful for product listing validation.
- Helps in documentation and customs-related requirements.
- Provides accurate image dimensions and variant data.
- Saves time for Amazon sellers and operations teams.
- Improves product image management and data consistency.
