APLUS IMAGES

The **APLUS Images program** is used to check the **availability and usage status of ASINs**. The tool reads ASINs from a text file and verifies whether those ASINs already contain product descriptions or if they are available to use.

First, users must create a text file named **input.txt** and enter the ASINs in the file. Each ASIN must be written on a **separate line** without adding any extra spaces.

After preparing the input file, run the **APLUS_Image_V7** tool. When the program starts, **five Chrome browser windows will automatically open** and the tool will begin analyzing each ASIN.

Once the process is completed, the tool generates an output file named **APS_output.txt**.

In the output file, each ASIN is labeled with a **status** that helps users quickly decide whether the ASIN can be used or not.

ASINs marked as **No Data** or **Unavailable** can be safely used, while ASINs labeled as **Link** should not be used because they already contain product descriptions.

The tool is optimized for **bulk processing**, allowing users to check multiple ASINs quickly. The processing time depends on the number of ASINs entered in the input file. On average, it takes **about 1 minute for 10 ASINs** and **around 3 minutes for 100 ASINs**.

APLUS Images Workflow

Step 1: Prepare Input File

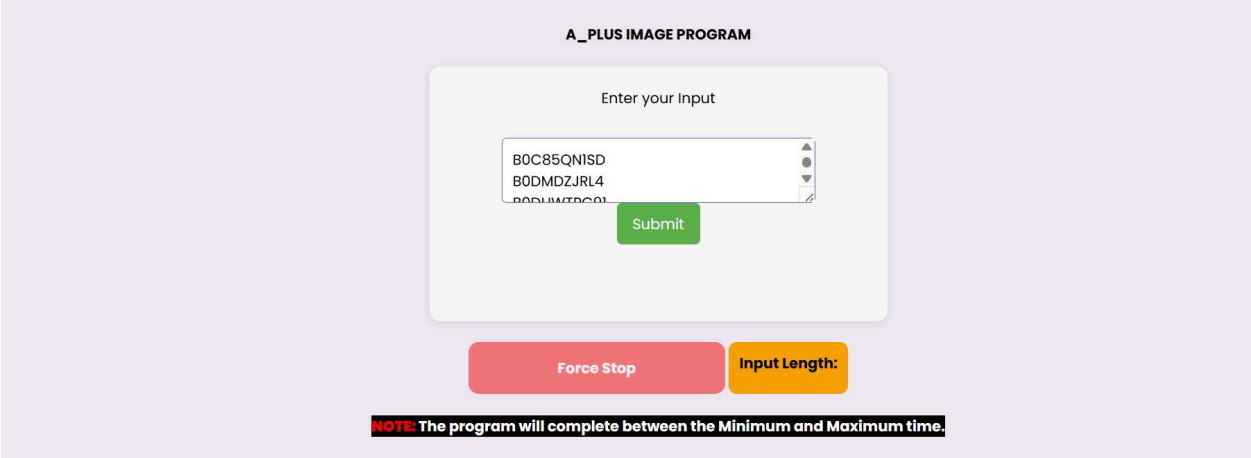
Create a text file named **input.txt**.

Enter the ASINs in the following format:

- One ASIN per line
- Do not include extra spaces

Example:

B0DRWP9CPK
B0ABC12345
B09XYZ6789



Step 2: Program Setup

Open the **APLUS Images Tool**.

Ensure the required **input.txt** file is placed in the correct folder.

Run the program.

Step 3: Program Execution

When the program starts:

- The tool automatically opens **5 Chrome browser windows**.

- Each browser is used to process ASIN data.

Do not close or interact with the browser windows while the program is running.

The tool checks the **A+ content availability** for each ASIN.

Processing time depends on the number of ASINs.

Example processing time:

- 10 ASINs → ~1 minute
- 100 ASINs → ~3 minutes

Step 4: Output

After the process is completed, the program generates an output file.

Output file name:

APS_output.txt

Open the file to view the ASIN results and their status.

ASIN Usage Notes

Status	Action
No Data	Use these ASINs
Unavailable	Use these ASINs
Link	Do not use these ASINs because they already contain product descriptions.
