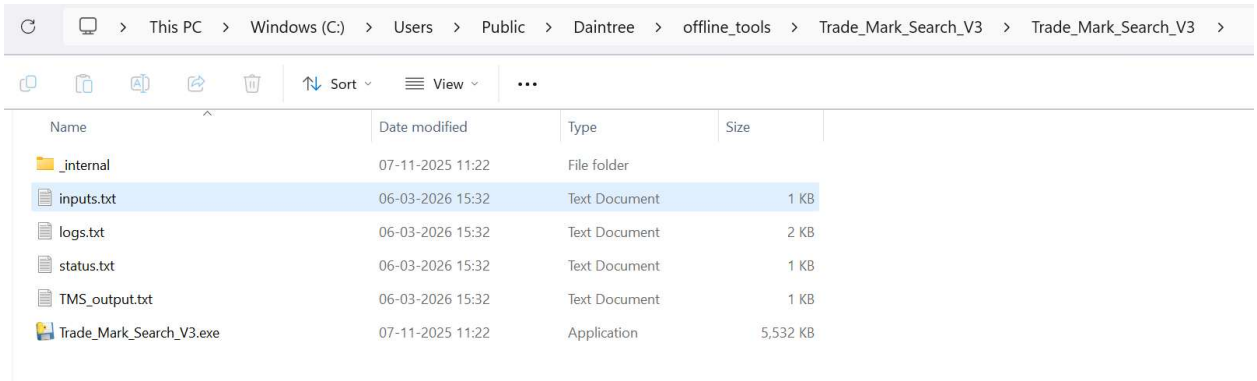
Trade Mark Search

The **Trade Mark Search program** is used to verify whether a **brand name is already registered as a trademark**. This tool automates the process of checking multiple brand names and provides clear results indicating whether the trademark is **registered or available**.
First, users must prepare an **input file named** `inputs` and enter the brand names in the file.
Each brand name must be written on a **separate line** without adding extra spaces or special characters.
After preparing the input file, run the **Trade Mark Search** tool. The program reads each brand name and checks it against **trademark registration records**.
Once the program finishes execution, it generates an output file named **TMS_output.txt**.
The output file contains the trademark status for each brand name. The results are displayed using **boolean values**:

- **true** → The trademark is registered and the brand name is **not available for use**.
- **false** → The trademark is not registered and the brand name **available for use**.

This tool helps users **quickly verify brand availability**, avoid legal issues related to registered trademarks, and save time by automating multiple trademark checks.



Trade Mark Search Workflow

Step 1: Prepare Input File

Create a text file named **inputs.**

Enter the **brand names** in the following format:

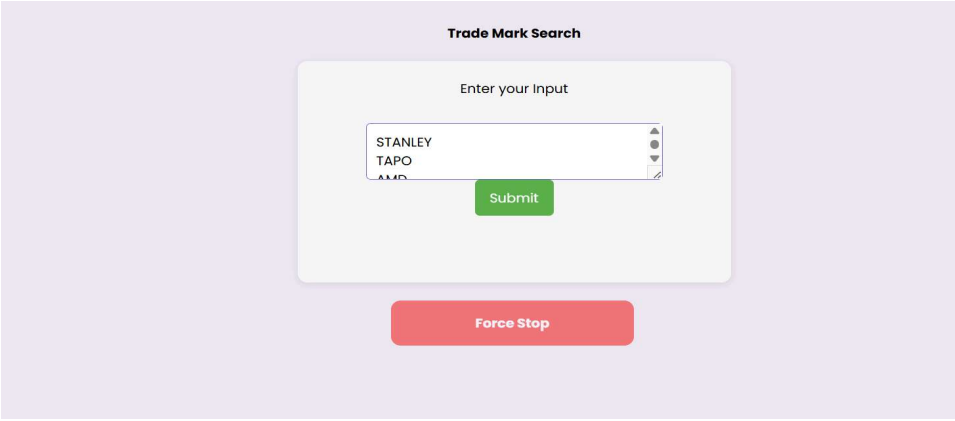
- One brand name per line
- Do not include extra spaces or special characters

Example:

Amd

Jbl

ACETONER



Step 2: Program Setup

Open the **Trade Mark Search tool in one app.**

Tool name:

Trade Mark Search

Ensure the required **inputs** file is placed in the correct folder.

Run the program.

Step 3: Program Execution

When the program starts:

- The tool reads each **brand name** from the input file.

- It checks the brand name against **trademark registration records.**
- The system determines whether the trademark is **registered or not.**

The results are automatically compiled.

Step 4: Output

After processing all brand names, the program generates an output file.

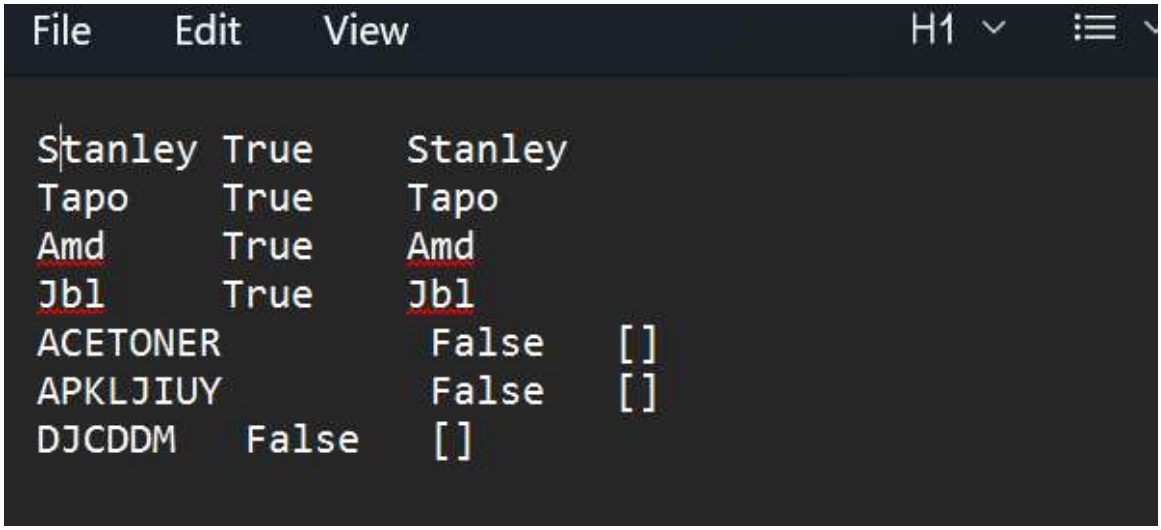
Output file name:

TMS_output.txt

Example output:

Meaning:

- **true** → Trademark already registered
- **false** → Trademark not registered and may be available



Manual Check (Optional)

If you want to manually verify a **single brand name**, you can search it on the following website:

https://www.quickcompany.in/trademarks

Steps:

1. Open the website.
2. Enter the **brand name** in the search bar.
3. View the trademark status.

Purpose and Benefits

- Quickly verify **brand name availability.**
- Avoid **legal issues with registered trademarks.**
- Save time by checking **multiple brand names automatically.**
- Useful for **product listings, brand creation, and business use.**
